Click to expand Try this config plist, works with my setup using UEFI boot for El Capitan and Sierra, though I skipped Yosemite.. I followed an advice and remove Ethernet from the network manager in Settings, hoping it'd come back after reboot but alas, it doesn't.. I just stripped my generated serial numbers Also make sure you have the Clover drivers OSxAptioFixDrv, DataHubDxe, and OSXFatBinaryDrv UEFI if you go that route.. Anybody experienced anything similar? Edit: figured it out, apparently if you boot using the USB (UniBeast) then the network would work due to the extra loaded kext in UniBeast.. Sometimes it does, but more often than not it doesn't Also I'm running into another bizarre error, while I have Ethernet up and working after the first boot, after reboot it went offline completely.

Hi rgill035, I suggest that you update the drivers for the wireless card from the following link: Please follow the steps provided below to increase the roaming aggressiveness after updating the drivers: 1.. I7 3770 8GB Ram AMD R9 270x (Originally came with the GT 640) 512GB Toshiba SSD, 1TB WD HDD The issues that I'm facing are that the only sound card slot that works is the one in the top of the case, I cant manage to read my secondary NTFS HDD (although I can see it in the disk utility), and sometimes the whole system is freezing.. If anyone could help I would appreciate it P S I used sareddy72's configuration.. Of course you have to make sure FakeSMC is also loaded in the right folder, EFI/CLOVER/kexts/10.
